Walkway suspension in an Underground station

Bilbao, Spain

In the recent Underground stations across the capital of the Spanish Basque region, stainless steel grade 316 is a common feature for stairwells and claddings, where their aesthetic qualities and proven low-maintenance properties are an asset. There is, however, one additional feature that makes some of them quite special: the landings

seem to hover above the platforms and rails. Filigree stainless steel suspension bars make this elegant construction possible.

As the stairs and elevated access paths are part of the escape route, they have to meet high fire resistance requirements. Stainless steel 310S (EN 1.4845) is a 24-26 % Cr, 19-22 % Ni austenitic grade that is otherwise used for its heat resistance in industrial high-temperature applications. The structural engineers used their mechanical and physical properties to translate the architect's daring concept into a technical solution.

Details

Environment: Urbar

Architects: Norman Foster

Structural engineers: Ingenería Metro de Bilbao,

S.A. (IMEBISA)

Owner/developer: Bilbao Council

Fabricator: Gramometal, Ortuella, Spain

Stainless steel grade: 316 (EN 1.4401) and 310S

(EN 1.4845)

Product type: Sheet, bar

Surface finish: 2B

Total quantity: 50 t of grade 310S and 70 t of

grade 316 per station

Producer or supplier: Acerinox

More information: cedinox.es
